## Introduction

This document describes the procedure for recovering an **enable password** or **enable secret** passwords. These passwords are used to protect access to privileged EXEC and configuration modes. The **enable password** password can be recovered but the **enable secret** password is encrypted and can only be replaced with a new password using the procedure below.

**Note:** This password recovery procedure works for the following Cisco products:

• Cisco 806		
• Cisco 827	• Cisco 4700	• Catalyst 2948G-L3
• Cisco uBR900	• Cisco AS5x00	• Catalyst 4840G
• Cisco 1003	• Cisco 6x00	• Catalyst 4908G-L3
• Cisco 1004	• Cisco 7000 (RSP7000)	• Catalyst 5500 (RSM)
• Cisco 1005	• Cisco 7100	• Catalyst 8510-CSR
• Cisco 1400	• Cisco 7200	• Catalyst 8510-MSR
• Cisco 1600	• Cisco 7500	• Catalyst 8540-CSR
	• Cisco uBR7100	• Catalyst 8540-MSR • Cisco MC3810

• Cisco 1700	• Cisco uBR7200	
• Cisco 2600	• Cisco	
• Cisco 3600	uBR10000	• Cisco NI-2
• Cisco 4500	• Cisco 12000	• Cisco VG200 Analog Gateway
	• Cisco LS1010	• Route Processor Module

## Before You Begin

### Conventions

For more information on document conventions, see the Cisco Technical Tips Conventions.

### Prerequisites

There are no specific prerequisites for this document.

## Step-by-Step Procedure

To recover your password, follow the steps below:

1. Attach a terminal or PC with terminal emulation to the console port of the router.

Use the following terminal settings:

- ◆ 9600 baud rate
- ◆ No parity
- ◆ 8 data bits
- ◆ 1 stop bit
- ◆ No flow control

For additional information on cabling and connecting a terminal to the console port or the AUX port, refer to the following documents:

- ◆ Cabling Guide for Console and AUX Ports on Cisco Routers
- ◆ Connecting a Terminal to Catalyst 2948G-L3, 4908G-L3, and 4840G Series Switches
- ◆ Catalyst 8510CSR, and 8540CSR Switches Console Port Pinouts

2. If you still have access to the router, type **show version** and record the setting of the configuration register; it is usually 0x2102 or 0x102.

Click [here](#) to see the output of a **show version** command.

3. If you don't have access to the router (because of a lost login or TACACS password), you can safely consider that your configuration register is set to 0x2102.
4. Using the power switch, turn off the router and then turn it back on.

**Important:** To simulate step 4 on a Cisco 6400, pull out and then replace the Node Route Processor (NRP) or Node Switch Processor (NSP) card.

**Important:** To simulate step 4 on a Cisco 6x00 using NI-2, pull out and then replace the NI-2 card.

5. Press **Break** on the terminal keyboard within 60 seconds of the power-up to put the router into ROMMON.

If the break sequence doesn't work, see Possible Key Combinations for Break Sequence During Password Recovery for other key combinations.

6. Type **confreg 0x2142** at the rommon 1> prompt to boot from Flash without loading the configuration.
7. Type **reset** at the rommon 2> prompt.

The router reboots but ignores its saved configuration.

8. Type **no** after each setup question or press **Ctrl-C** to skip the initial setup procedure.
9. Type **enable** at the Router> prompt.

You'll be in enable mode and see the Router# prompt.

10. **Important:** Type **configure memory** or **copy startup-config running-config** to copy the nonvolatile RAM (NVRAM) into memory.

Do *not* type **configure terminal**.

11. Type **write terminal** or **show running-config**.

The **show running-config** and **write terminal** commands show the configuration of the router. In this configuration you see under all the interfaces the **shutdown** command, which means all interfaces are currently shutdown. Also, you can see the passwords (enable password, enable secret, vty, console passwords, and so on) either in encrypted or unencrypted format. The unencrypted passwords can be re-used, the encrypted ones will have to be changed with a new one.

12. Type **configure terminal** and make the changes.

The prompt is now **hostname(config)#**.

13. Type **enable secret <password>** to change the **enable secret** password, for example.
14. Issue the **no shutdown** command on every interface that is used.

If you issue a **show ip interface brief** command, every interface that you want to use should be "up up".

15. Type **config-register 0x2102**, or the value you recorded in step 2.
16. Press **Ctrl-z** or **end** to leave the configuration mode.

The prompt is now **hostname#**.

17. Type **write memory** or **copy running-config startup-config** to commit the changes.

## Example of Password Recovery Procedure

The example below presents an actual password recovery procedure. We created this example using a Cisco 2600. Even if you are not using a Cisco 2600, this example will be almost exactly what you experience on your product.

```
Router>enable
Password:
Password:
Password:
% Bad secrets
```

```
Router>show version
